

CHAIN POKER GENESIS BY LAEV

11.0 PROTOCOL DOCUMENTATION ENGINE

Official Technical Specification v1.1 - Corrected and Audited

LCCP: SEQ 11 | PREV 10 | SELF 11 | NEXT 12

CLASS: CORE ENGINE

STATUS: CONSOLIDATED / CORRECTED / AUDITED / INTEGRATION-READY

1. PURPOSE AND BOUNDARY

The Documentation Engine manages, versions, validates, publishes, distributes and preserves official protocol documentation. It is a documentary knowledge layer for users, developers, node operators, researchers and auditors.

It does not execute poker logic, determine winners, authorize wallet spending, decide membership, replace consensus or the ledger, control TABLE_WALLET_INSTANCE lifecycle, or execute monetary settlements.

2. AUTHORITY AND LIFECYCLE

Official status requires an authorized document record plus integrity metadata.

Authorship, storage, mirroring and communication are separate roles.

Lifecycle: DRAFT -> REVIEW -> VALIDATED -> AUTHORIZED -> PUBLISHED -> REPLICATED -> SUPERSEDED -> ARCHIVED. REJECTED and WITHDRAWN are exception states.

Document version and protocol version are independent identifiers.

3. DISTRIBUTION, INTEGRITY AND ACCESS

The documentary model is logically centralized while physical storage is distributed across repository mirrors, IPFS nodes, cloud nodes and archives. Storage location is not authority.

Published content should have a deterministic cryptographic content identifier. An IPFS CID identifies content but does not alone establish official status.

The player UI exposes essential documents. Developers and auditors may access the full index, history and integrity metadata. A communication/press node may distribute releases and education but cannot alter official technical authority.

4. INTEGRATION 08 -> 09 -> 10

Engine 08 retains table-join authority. Engine 11 documents join requirements but does not replace runtime join authority.

Engine 09 retains authority over TABLE_WALLET_INSTANCE and its cryptographic configuration lifecycle. Engine 11 cannot create, authorize, modify, suspend or close a TABLE_WALLET_INSTANCE.

Engine 10 retains authority over connection, reconnection, absence, abandonment and participant-removal workflow. Engine 11 may preserve specifications and historical evidence without changing operational state.

5. AUDIT AND CLOSURE

Audit baseline: frozen 01-10 chain.

PASS: LCCP position 11 / 10 / 11 / 12.

PASS: Engine 08 boundary.

PASS: Engine 09 wallet boundary.

PASS: Engine 10 disconnection boundary.

PASS: ledger boundary.

PASS: version separation.

PASS: storage versus authority.

PASS: integrity model.

PASS: communication-node separation.

PASS: player-interface boundary.

Normative rule: Engine 11 does not decide winners, settlement amounts, membership removal or consensus outcomes.

FINAL 01 -> 11 FREEZE: PENDING integrated audit including this Engine 11. Next formal step: final integrated audit 01 -> 11. If passed: FROZEN.

6. PROTOCOL PHILOSOPHY

The principle "Code does not discriminate" means protocol behavior should apply published deterministic rules consistently within their defined scope. It is a design principle, not a replacement for technical, legal, security or explicit protocol constraints. Knowledge is part of the protocol ecosystem because participants must inspect rules, versions and historical changes.

End of corrected v1.1 specification.
